Learning Objectives

- Understand that methods inherited by a subclass can be overwritten in the definition for that subclass
- See an example of a child class in which methods from the parent class are overwritten

Overriding Methods

Child class re-defines a method from the parent class

Similar to overloading

Overriding vs Overloading

Both create methods with the same name

Overloading   in the same class
chosen by their signatures (parameters)

Overriding   defined in a parent class
can use the same signature
